

Processing HCI

In our team project, we used ProcessingHCI ideas to try to work better with design and user experience. I read the article “A Simple Introduction to Lean UX” and learned that Lean UX focuses on fast iterations, user feedback and teamwork. The main ideas are to simplify the design process, learn quickly from mistakes and work in small steps.

Our team, in my experience, was working hard to get the job done. We all shared ideas and our roles were well defined. But, from time to time, we talked about details for too long. To speed up decision making, a lean process requires the team to have fewer roles and activities.

I think the lean process is worth it because it helps us get user feedback quickly. It is important to test our ideas with users and change our designs based on what we learn. The benefits are better design and a faster process. Even if it takes some extra work to set up the lean process, the cost is low compared to the benefits.

In conclusion, I believe our team's process could be more agile if we focused on reducing extra steps and improving communication. A lean process can save time and create better products when everyone works together with a clear goal.
