

Well, the main difference between user experience and user interface is that **user experience is about how satisfied the user feels when using the app**. For example, if the app is easy to understand, if it is logical, and if the user knows how to do a task without someone explaining everything. On the other hand, the user **interface is more about how the site looks**. It includes using the right colors for the context, having images of a good size, choosing the right font color, size, and type, etc.

In our project, for the user experience, one example is the menu layout. **We have different menus on a side bar, and users can move from one to another quickly, which makes the app easy to use**. Also, the buttons inside the menus are big, and the icons are easy to understand. For example, we have a calendar icon, and the user can know what it means just by looking at it.

For the user interface, we decided to **use the same colors as the official UADY psychology website**. These **colors have good contrast and are nice to look at**. We also chose a font that is easy to read. We didn't use cursive letters, because they are usually thin and not easy to read for everyone. Instead, we picked a font that is clear and simple.
