

UI vs UX

In our team project, we learned the difference between User Interface and User Experience. According to the article "UX vs UI: What's the Difference (And How They Apply to WordPress)" [1], UI is about how the product looks, like colors, buttons, and fonts, while UX is about how easy and satisfying it is to use the product.

In our project, the design of an appointment control system for SEAP.

An example of UI was when we chose the blue color "uady" for the main menu and designed round buttons for navigation. The idea was to have a modern and clean look. This demonstrates UI because it's all about the design and the visual part.

An example of UX was when we were working on implementing spatial buttons that cause a satisfying feeling when completing an action, specifically we are implementing it in the "Agenda" part and appointment management, we need buttons that show the user that something specific has been successfully completed.

The most important thing I learned is that a good user interface does not mean a good user experience. Our app looked good, but at first it was not easy to use. We had to work on both UI and UX to make it beautiful and comfortable for users. Now I understand that UI and UX have to work together for a product to be successful.
